The kinetic energy of a moving object is equal to the work required to bring it to its speed from rest, or the work the object can do while being brought to rest. $Fd = \frac{1}{2}mv^2$ Work-Energy theorem

Conceptual Physics - Chapter 9: Energy Flashcards | Quizlet

Include all that apply. Work is a form of energy. A Watt is the standard metric unit of work. Units of work would be equivalent to a Newton times a meter. A $\text{kg}\cdot\text{m}^2/\text{s}^2$ would be a unit of work. Work is a time-based quantity; it is dependent upon how fast a force displaces an object.

Work and Energy Review - with Answers #1 - Physics

It is equal to the mass multiplied by the square of the speed, multiplied by the constant $\frac{1}{2}$. *Work = ΔKE *. This can be derived as follows: If we multiply both sides of $F = ma$ (Newton's 2nd law) by d , we get $Fd = mad$. Recall from Chapter 3 that, for constant acceleration, $d = \frac{1}{2}at^2$, so we can say $Fd = ma(\frac{1}{2}at^2) = \frac{1}{2}maat^2 = \frac{1}{2}m(at)^2$; and substituting $\Delta v = at$, we get $Fd = \Delta\frac{1}{2}mv^2$.

W (in) = 3.0 J W (out) = 2.94 J Compare W (in) to W (out) - The input work and output work are nearly the same (conservation of energy), but friction acts for 0.6 m and removes a small amount of energy ($F \times D$), thus a slightly greater input work. If the pulley has little friction, the values will be very close.

Answered: Explain work as a transfer of energy... | bartleby

work are zero, and, according to the work-energy theorem, is the energy transfer due to a $KE = 0$. The kinetic energy doesn't change. The work-energy theorem applies to decreasing speed as well. The more kinetic energy something has, the more work is required to stop it. Twice as much kinetic energy means twice as much work.
