Abstract. We investigate the cross-sectional return predictability of delta-hedged equity options using machine learning and big data. Drawing upon more than 12 million observations over the period from 1996 to 2020, we find that allowing for nonlinearities significantly increases the out-of-sample performance of option and stock characteristics in predicting future option returns.

Using Machine Learning to Predict Options Returns
Stock selection and weights are derived from factor scores resulting in portfolio capturing the essence of underlying factor dynamics With threshold mechanism that lays down stringent criteria for inclusion and exclusion, the index seeks to minimize degree of churning and replication cost
